A Note on Certain Analytic Functions

Mamoru NUNOKAWA, Shigeyoshi OWA and Emel YAVUZ

Abstract

The object of the present paper is to obtain some interesting properties of analytic functions.

1 Introduction

Let \mathcal{A} denote the class of functions of the form

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n$$

which are analytic in the unit disc $\mathbb{E} = \{z \mid |z| < 1\}$. Sakaguchi [1] proved the following theorem.

Theorem A. *If $f(z) \in \mathcal{A}$ satisfies the condition*

$$\operatorname{Re} \frac{zf'(z)}{f(z) - f(-z)} > 0 \text{ in } \mathbb{E}, \quad (1)$$

then $f(z)$ is univalent and starlike with respect to symmetrical points in \mathbb{E} .

We call $f(z)$ a Sakaguchi functions which satisfies the condition (1).

In this paper, we need the following lemma.

Lemma 1. *Let $f(z) \in \mathcal{A}$ and*

$$\operatorname{Re} \frac{zf'(z)}{f(z)} > K \text{ in } \mathbb{E}$$

where K is a real and bounded constant, then we have

$$f(z) \neq 0 \text{ in } 0 < |z| < 1.$$

2 Results

Theorem 1. *For arbitrary positive real number α , $0 < \alpha \leq \pi$, if $f(z) \in \mathcal{A}$ satisfies the following condition*

2005 Mathematics Subject Classification: Primary 30C45.

Key words and phrases: Analytic function, Sakaguchi function.

$$\operatorname{Re} \frac{z(e^{i\alpha} f'(ze^{i\alpha}) - f'(z))}{f(ze^{i\alpha}) - f(z)} > 0 \text{ in } E, \quad (1)$$

then $f(z)$ is univalent in E .

Proof. If there exists a r , $0 < r < 1$ for which $f(z)$ is univalent in $|z| < r$ but $f(z)$ is not univalent on $|z| = r$, then there exists two points $z_1, z_2 = z_1 e^{i\alpha}$, $0 < \alpha \leq \pi$,

$$f(z_1) = f(z_2) \quad (2)$$

and $f(z)$ is univalent on the arc C where

$$C = \{z | z = z_1 e^{i\theta}, 0 \leq \theta < \alpha\}. \quad (3)$$

From the assumption of Theorem 1, we have

$$\operatorname{Re} \frac{z(e^{i\alpha/2} f'(ze^{i\alpha/2}) - f'(z))}{f(ze^{i\alpha/2}) - f(z)} > 0 \text{ in } E. \quad (4)$$

This shows that $(f(ze^{i\alpha/2}) - f(z))$ is starlike with respect to the origin.

From (2) and (3), we get the following image of $|z| = r$ under the mapping $w = f(z)$,

where β is sufficiently small positive real number.

Then vectors $(f(z_1 e^{i\alpha/2}) - f(z_1))$ and $(f(z_1 e^{i(\alpha/2 + \beta)}) - f(z_1 e^{i\beta}))$ move on the clockwise direction (the negative direction). This contradicts (4) and it completes the proof. \square

Another proof of Theorem 1. If there exists a r , $0 < r < 1$ for which $f(z)$ is univalent in $|z| < r$ but $f(z)$ is not univalent on $|z| = r$, then there exists at least two points $z_1, z_2 = z_1 e^{i\alpha}$, $0 < \alpha \leq \pi$ and for which

$$f(z_1) = f(z_2).$$

Applying Lemma 1 and from the hypothesis (1), we have

$$f(ze^{i\alpha}) - f(z) \neq 0.$$

This is a contradiction and therefore, it completes the proof.

□

Remark. If $f(z) \in \mathcal{A}$ satisfies the condition (1) only for the case $\alpha = \pi$, then $f(z)$ is a Sakaguchi function.

Theorem 2. If $f(z) \in \mathcal{A}$ satisfy the following condition for sufficiently small and positive real number δ and arbitrary real number α , $0 < |\alpha| < \delta$ for which

$$\operatorname{Re} \frac{z(e^{i\alpha} f'(ze^{i\alpha}) - f'(z))}{f(ze^{i\alpha}) - f(z)} > 0 \text{ in } \mathbb{E}. \quad (5)$$

Then $f(z)$ is convex in \mathbb{E} or

$$1 + \operatorname{Re} \frac{zf''(z)}{f'(z)} > 0 \text{ in } \mathbb{E}.$$

Proof. From the hypothesis (5), all the tangent vector of \mathbb{C} which is the image of $|z| = r$, $0 < r < 1$ under the mapping $w = f(z)$ move in the counterclockwise direction. Geometrically, this shows that $f(z)$ is convex in \mathbb{E} or

$$1 + \operatorname{Re} \frac{zf''(z)}{f'(z)} > 0 \text{ in } \mathbb{E}.$$
